

ABSTRACT

5 A conductive fluoro-resin composition of the addition  
reaction curing type is provided comprising (A) a reactive  
fluorinated polyether compound comprising fluorinated  
polyether units and having at least two aliphatic  
unsaturated hydrocarbon radicals in a molecule, (B) a  
10 compound having at least two hydrogen atoms each directly  
attached to a silicon atom, (C) a platinum group metal  
catalyst, and (D) silver particles. The composition cures  
into rubbery parts having improved heat resistance, weather  
resistance and solvent resistance and optionally forming  
firm bonds to various substrates.
